“EXCELLENCE THROUGH KNOWLEDGE SHARING”

About Workshop:

Regional Mineral Targeting (RMT) is one of the strategic process of identifying new areas with high potential zones for mineral prospecting over large geological terrains. It involves integration of geological, geophysical, geochemical, and remote sensing data to locate potential areas for mineral exploration. This process is a key step in mineral exploration and plays a crucial role in extending mineral search in the country. Regional Mineral Prospecting is a systematic approach for prospecting and exploration of mineral deposits in a large province i.e. at least in an area of 500 sq.km to 1000 sq.km. The Purpose of RMT is to locate new mineral resources of Critical minerals especially for concealed and deep-seated mineral deposits based on the anomalies identified through data integration, or differences between what is observed and what is expected. The approach is cost-effective, time-efficient, can reduce environmental impact and also helps to identify areas that are favorable for further exploration activities.
